ABSTRACT: Cellular interactions are critical for the regulation of
hematopoiesis. The sialomucin PSGL-1/CD162 mediates the attachment of
mature leukocytes to P-selectin. We now show that PSGL-1 also functions
as the sole receptor for P-selectin on primitive human CD34+
hematopoietic progenitor cells (HPC). More importantly, ligation of
PSGL-1 by immobilized or soluble ligand or anti-PSGL-1
antibody results in a profound suppression of HPC proliferation
stimulated by potent combinations of early acting hematopoietic growth
factors. These data demonstrate an unanticipated but extremely marked
growth-inhibitory effect of P-selectin on hematopoiesis and provide
direct evidence that PSGL-1, in addition to its well-documented role as
an adhesion molecule on mature leukocytes, is a potent negative regulator
of human hematopoietic progenitors.
